## What is Icomparable Interface?

- IComparable is an interface defined in the System namespace that provides a method for comparing an instance of a class to another instance of the same class.
- The primary purpose of Icomparable is to provide a standard way to compare objects, allowing them to be ordered or sorted based on a specific field or property.
- This is especially useful when working with collections that need to be sorted or when determining the position of an object relative to others in a list.

## Conclusion:

- The IComparable interface is essential for defining how objects are compared and sorted within collections in C#.
- By implementing IComparable, developers gain fine-grained control over the order of their custom objects, facilitating efficient sorting and ordering operations based on custom criteria.
